xtpxlib is an open source library containing software for processing XML, using languages like XSLT and XProc. It consists of several separate components, all named `xtpxlib-*`. Everything can be found on GitHub (<https://github.com/xatapult>). See its description for more information.

1 Description

The Xatapult XML Library currently consists of the following components:

Component	Description
xtpxlib-common	Common component: Shared libraries and IDE support

2 Usage

2.1 Installing xtpxlib components

To install an **xtpxlib** component you can do one of the following:

- Clone its GitHub repository to some appropriate location on disk. The `master` branch will always contain the latest stable version.
- Or download the latest release zip from its git website (releases page) and unpack it somewhere.

That's all folks...

2.2 Running xtpxlib components

xtpxlib consists mainly of XProc (1.0) pipelines and XSLT (2.0 and 3.0) stylesheets. To run these you'll need:

- To run the XProc pipelines use [XML Calabash](#) Xproc 1.0 processor. This library uses several of its non-standard extensions, another XProc processor is therefore probably not usable.
- To run XSLT stylesheets the [Saxon](#) processor is preferred. In most cases the (open source) HE (Home Edition) version will be sufficient. If not a PE (Professional Edition) license is necessary.
- As an alternative run the software from within the [oXygen XML](#) IDE.
